Machine learning, the tool currently driving the development of artificial intelligence, has recently seen exponential growth in its sophistication and influence. In this issue of *Anesthesiology*, we explore three examples of machine learning applied to our field. Lee et al. use machine-learning techniques to predict postoperative mortality from electronic health record data. Kendale et al. predict hypotension by leveraging data available during induction, and Hatib et al. predict hypotension using data from high-fidelity arterial line waveforms. In an accompanying Editorial View, Mathis et al. describe what the practicing anesthesiologist needs to know about artificial intelligence for anesthesia. Illustration by Annemarie Johnson, Vivo Visuals.

PERIOPERATIVE MEDICINE

CLINICAL SCIENCE

Development and Validation of a Deep Neural Network Model for Prediction of Postoperative In-hospital Mortality
C. K. Lee, I. Hofer, E. Gabel, P. Baldi, and M. Cannesson
649

The authors’ neural network model was comparable in accuracy to, but potentially more efficient at feature selection than logistic regression models. Deep neural network–based machine learning provides an alternative to conventional multivariate regression. SUPPLEMENTAL DIGITAL CONTENT IS AVAILABLE IN THE TEXT

Machine-learning Algorithm to Predict Hypotension Based on High-fidelity Arterial Pressure Waveform Analysis
663

A machine-learning algorithm based on thousands of arterial waveform features can identify an intraoperative hypotensive event 15 min before its occurrence with a sensitivity of 88% and specificity of 87%. Further studies must evaluate the real-time value of such algorithms in a broader set of clinical conditions and patients. SUPPLEMENTAL DIGITAL CONTENT IS AVAILABLE IN THE TEXT

Supervised Machine-learning Predictive Analytics for Prediction of Postinduction Hypotension
S. Kendale, P. Kulkami, A. D. Rosenberg, and J. Wang
675

Among 13,323 patients undergoing a variety of surgical procedures, 8.9% experienced a mean arterial pressure less than 55 mmHg within 10 min of induction start. While some machine-learning algorithms perform worse than logistic regression, several techniques may be superior. Gradient boosting machine, with tuning, demonstrates a receiver operating characteristic area under the curve of 0.76, a negative predictive value of 19%, and positive predictive value of 96%. Liposomal Bupivacaine Does Not Reduce Inpatient Opioid Prescription or Related Complications after Knee Arthroplasty: A Database Analysis
689

Retrospective analysis of a national observational data set showed that liposomal bupivacaine use for total knee arthroplasty is increasing. Liposomal bupivacaine use was not associated with clinically meaningful reductions in inpatient opioid use, opioid-related complications, or resource utilization in patients who received modern pain management including a peripheral nerve block. SUPPLEMENTAL DIGITAL CONTENT IS AVAILABLE IN THE TEXT

Anesthesia Care Team Composition and Surgical Outcomes
700

Using national claims data for 443,000 Medicare beneficiaries, the influence of care team composition on inpatient mortality, inpatient length of stay, and inpatient spending was evaluated. There were no significant differences in mortality, length of stay, or inpatient spending between the care team models. SUPPLEMENTAL DIGITAL CONTENT IS AVAILABLE IN THE TEXT
Preoperative Epoetin-α with Intravenous or Oral Iron for Major Orthopedic Surgery: A Randomized Controlled Trial
P. Biboulet, S. Bringuier, P. Smilevitch, T. Loupec, C. Thuile, M. Pencole, G. Maissiat, G. Dangelser, and X. Capdevila

Hemoglobin concentration the day before surgery was 1 g/dl greater in 50 patients randomized to intravenous iron than in those assigned to oral iron. About half the patients given oral iron reported gastrointestinal symptoms. Intravenous iron is preferable to oral iron as a supplement to epoetin-α.

Complications in Pediatric Regional Anesthesia: An Analysis of More than 100,000 Blocks from the Pediatric Regional Anesthesia Network

In a prospective multicenter cohort of more than 100,000 blocks in children, there were no cases of permanent neurologic deficit associated with regional anesthesia. The rate of transient neurologic deficit was low at 2.4 per 10,000, and the incidence of local anesthesia toxicity was also low at 0.76 per 10,000.

BASIC SCIENCE

Breakdown of Neural Function under Isoflurane Anesthesia: In Vivo, Multineuronal Imaging in Caenorhabditis elegans

Even though exposure to 4% isoflurane prevented movement, neurons in the movement circuitry remained highly active. However, the coordination among the neurons of the command circuitry was lost in comparison to the awake state. The data suggest that the primary cause of the lack of motion in worms is not the suppression of neuronal activity per se but rather the loss of coordination between neurons in the command circuit.

Anesthetics Have Different Effects on the Electrocorticographic Spectra of Wild-type and Mitochondrial Mutant Mice
C. W. Carspecken, S. Chanprasert, F. Kalume, M. M. Sedensky, and P. G. Morgan

While isoflurane and halothane suppressed electrocorticography in all frequency bands in control mice, in Ndufs4 knockout mice, both agents decreased power in the higher frequency bands (beta, gamma), whereas activity in the lower bands (delta, theta, and alpha) was maintained. Ketamine also decreased power in the Ndufs4 knockout mice in the beta and gamma frequency bands only. The data indicate that in Ndufs4 knockout mice, an energetic state in glutamatergic neurons impacts anesthetic sensitivity, and this sensitivity is reflected in cortical electrical activity.

Stereoselective Ketamine Metabolism by Genetic Variants of Cytochrome P450 CYP2B6 and Cytochrome P450 Oxidoreductase
P.-F. Wang, A. Neiner, and E. D. Kharasch

Several genetic variants of CYP2B6 and P450 oxidoreductase have diminished ketamine N-demethylation activity. Variants do not have altered stereoselectivity of ketamine metabolism. Results suggest candidate polymorphisms of CYP2B6 and P450 oxidoreductase for clinical evaluation.

CRITICAL CARE MEDICINE

STANDARDIZED UNLOADING OF RESPIRATORY MUSCULES DURING NEURALLY ADJUSTED VENTILATORY ASSIST: A RANDOMIZED CROSSOVER PILOT STUDY
F. Campoccia Jalde, F. Jalde, M. K. E. B. Wallin, F. Suarez-Sipmann, P. J. Radell, D. Nelson, S. Eksborg, and P. V. Sackey

This pilot study of 10 patients titrated neurally adjusted ventilatory assist to different levels of diaphragm unloading; less unloading was associated with greater diaphragm activity and improved ventilation of dependent lung.
BASIC SCIENCE

Incisional Nociceptive Input Impairs Attention-related Behavior and Is Associated with Reduced Neuronal Activity in the Prefrontal Cortex in Rats

In a rat model of incisional pain, attention was impaired after injury and improved with an opioid analgesic. Diminished activity of the medial prefrontal cortex was found and may contribute to pain-induced impaired attention.

Effect of Thoracic Epidural Anesthesia in a Rat Model of Phrenic Motor Inhibition after Upper Abdominal Surgery

Upper abdominal incision in rats reduced phrenic motor output for several days after surgery. Thoracic epidural anesthesia using bupivacaine reduced incision-induced alterations in phrenic motor output. SUPPLEMENTAL DIGITAL CONTENT IS AVAILABLE IN THE TEXT

ORIGINAL INVESTIGATIONS IN EDUCATION

Association between Performance in a Maintenance of Certification Program and Disciplinary Actions against the Medical Licenses of Anesthesiologists

The introduction in 2000 of certificates that require participation in a program to maintain certification was not associated with a significant change in the incidence of disciplinary license actions. Completing maintenance of certification program requirements in a timely fashion was associated with a lower incidence of license actions. SUPPLEMENTAL DIGITAL CONTENT IS AVAILABLE IN THE TEXT

Reducing the Incidence of Substance Use Disorders in Anesthesiology Residents: 13 Years of Comprehensive Urine Drug Screening
M. G. Fitzsimons, K. Baker, R. Malhotra, A. Gottlieb, E. Lowenstein, and W. M. Zapol

The Massachusetts General Hospital randomly tested residents over a period of 13 yr. There was no detected substance abuse among residents during the testing period in 1,002 resident years, versus four incidents in the previous 719 resident years. This intriguing, but statistically fragile, result needs to be confirmed in other settings and other anesthesia clinicians.

INSTRUCTIONS FOR AUTHORS

The most recently updated version of the Instructions for Authors is available at www.anesthesiology.org. Please refer to the Instructions for the preparation of any material for submission to ANESTHESIOLOGY.

Manuscripts submitted for consideration for publication must be submitted in electronic format. The preferred method is via the Journal’s Web site (http://www.anesthesiology.org). Detailed directions for submissions and the most recent version of the Instructions for Authors can be found on the Web site (http://www.anesthesiology.org). Books and educational materials should be sent to Alan Jay Schwartz, M.D., M.S.Ed., Director of Education, Department of Anesthesiology and Critical Care Medicine, The Children’s Hospital of Philadelphia, 34th Street and Civic Center Blvd., Room 9327, Philadelphia, Pennsylvania 19104-4399. Article-specific permission requests are managed with Copyright Clearance Center’s Rightslink service. Information can be accessed directly from articles on the journal Web site. More information is available at http://anesthesiology.pubs.asahq.org/public/rightsandpermissions.aspx. For questions about the Rightslink service, e-mail customercare@copyright.com or call 877-622-5543 (U.S. only) or 978-777-9929. Advertising and related correspondence should be addressed to Advertising Manager, ANESTHESIOLOGY, Wolters Kluwer Health, Inc., Two Commerce Square, 2001 Market Street, Philadelphia, Pennsylvania 19103 (Web site: http://www.wkadcenter.com/). Publication of an advertisement in ANESTHESIOLOGY does not constitute endorsement by the Society or Wolters Kluwer Health, Inc. of the product or service described therein or of any representations made by the advertiser with respect to the product or service.

ANESTHESIOLOGY (ISSN 0003–3022) is published monthly by Wolters Kluwer Health, Inc., 14700 Citicorp Drive, Bldg 3, Hagerstown, MD 21742. Business office: Two Commerce Square, 2001 Market Street, Philadelphia, PA 19103. Periodicals postage paid at Hagerstown, MD, and at additional mailing offices.
